ENTERPRISE APPS & AGENTS

Power Platform Specialization

Detailed 15-Day Trainer-Ready Curriculum

15 HALF DAYS	60 HOURS	30 BUILDS
Two-week specialization	Instructor-led learning	Three guided builds daily

Build thread: Enterprise Code App → Dataverse → AI Builder → Copilot Studio Agent → Governed Automation → Capstone Project

Audience: Low-Code No-Code / MPP experienced
Daily format: 10:00 AM–2:00 PM training

1. Programme Overview

This curriculum converts the source programme into a delivery-ready plan. Learners progressively build one enterprise solution across 15 half days: a pro-code Power Platform application in Week 1 and a Copilot Studio agent in Week 2. Each day ends with a working increment, evidence of learning, and a capstone artefact.

Programme outcome: A demo-ready enterprise app-plus-agent solution with governed data, AI capabilities, automation, monitoring, evaluation evidence, ROI narrative and a judged pitch.

Learning architecture

- Explain before build: concepts and enterprise decision criteria
- Demonstrate: instructor-led walkthrough of the target pattern
- Guided build: three applied exercises each day
- Independent practice: repeat or extend the build without step-by-step guidance
- Evidence: commit, test result, design note, evaluation record or demo artefact

Industry application lanes

- Insurance: policy servicing, claims intake and claims resolution
- Banking: account opening, KYC and servicing
- Healthcare: registration, records and knowledge assistance
- Finance & Accounts: expense, invoice and ledger automation
- Supply Chain & Logistics: tracking, inventory and portal automation

Certification and assessment model

Component	Evidence	Weight	Success indicator
Daily builds	Working increments and Git commits	30%	Functional output with documented decisions
Knowledge checks	Short quizzes and verbal checks	15%	Conceptual understanding and terminology
Assignments	Independent extension tasks	20%	Correctness, completeness and reflection
Capstone solution	Integrated app-plus-agent build	25%	Outcome, execution, governance and reliability
Shark Tank pitch	Demo, evidence, ROI and Q&A	10%	Clear, evidence-led stakeholder story

Suggested achievement bands: Participation (completion evidence), Proficient (meets functional and governance criteria), and Distinction (strong quality, evaluation evidence and business value). These thresholds are delivery recommendations and can be adjusted to the organization's formal certification policy.

2. Ten-Day Curriculum Map

Day	Track	Theme	Daily shipment
1	App	Code Apps Foundations	Scaffold + app spec + data contract
2 & 3	App	AI-Assisted Development	Modular increment + tests + logging
4	Data	Dataverse Integration	Validated CRUD + relationships + tuned queries
5 & 6	AI	AI Builder & Prompt Builder	Intelligent increment + tested prompt
7 & 8	ALM	Testing, Deployment & Framing	Deployed solution + capstone brief
9 & 10	Agent	Enterprise Agent Design	Multi-topic agent + locked problem statement
11	RAG	Knowledge & Grounding	Cited, grounded agent + evaluation record
12	Action	Actions & Computer Use	Governed action + API-less automation design
13	Scale	Multi-Agent, MCP & Governance	Governed multi-agent solution + monitoring
14 & 15	Capstone	Build & Shark Tank	Integrated solution + outcomes pack + pitch

Recommended daily rhythm

The source specifies a four-hour instructor-led session from 10:00 AM to 2:00 PM, followed by practice, Q&A and assignment work. The breakdown below is a suggested facilitation pattern:

- 10:00–10:20: recap, learning outcomes and business context
- 10:20–11:05: concept block and instructor demonstration
- 11:05–11:15: short break
- 11:15–12:15: guided build 1 and 2
- 12:15–1:05: advanced concept block and guided build 3
- 1:05–1:45: integration, testing and troubleshooting
- 1:45–2:00: knowledge check, shipment review and assignment briefing

Day 01 | Code Apps Foundations & Environment Setup

Daily outcome: Select the right Power Platform app model, establish a professional development environment, and define the application and data contract.

Learning objectives

- Select the right Power Platform app model, establish a professional development environment, and define the application and data contract.
- Apply the day's concepts through three industry-aligned guided builds.
- Produce and review the Day 1 shipment as evidence of progress toward the capstone.

Instructor-led session plan | 10:00 AM–2:00 PM

Time	Block	Coverage / facilitation notes
10:00–10:20	Context & recap	Connect Day 1 to the running app-to-agent build. Review prior shipment and today's acceptance criteria.
10:20–11:05	Concept block 1	Power Platform evolution and the fusion-team delivery model; Code Apps runtime, application SDK, data plane and lifecycle; Decision framework: Code Apps vs Canvas vs Model-driven apps.
11:05–11:15	Break	Short break and environment check.
11:15–12:15	Guided builds 1–2	Banking: scaffold and run a Code App locally; Insurance: map a claims-servicing scenario to the appropriate app model.
12:15–1:05	Concept block 2	Developer environment provisioning, project scaffolding and configuration files; Visual Studio Code, Power Platform CLI, dependencies and local run loop; Git branching, pull requests, environment variables and configuration-driven design.
1:05–1:45	Guided build 3 & integration	Supply Chain: produce a shipment-tracking app specification and data contract. Integrate the day's output into the running solution and test the target path.
1:45–2:00	Check & close	Run the knowledge check, review evidence, explain assignment and capture blockers.

Detailed topic coverage

- Power Platform evolution and the fusion-team delivery model
- Code Apps runtime, application SDK, data plane and lifecycle
- Decision framework: Code Apps vs Canvas vs Model-driven apps
- Developer environment provisioning, project scaffolding and configuration files
- Visual Studio Code, Power Platform CLI, dependencies and local run loop
- Git branching, pull requests, environment variables and configuration-driven design

Hands-on builds

- H1. Banking: scaffold and run a Code App locally
- H2. Insurance: map a claims-servicing scenario to the appropriate app model
- H3. Supply Chain: produce a shipment-tracking app specification and data contract

Daily shipment and evidence

- Running scaffold
- One-page app specification
- Initial data contract
- Source-control repository and first commit

Post-lunch practice, Q&A and assignment

Re-scaffold independently, explore the generated project structure, document one model-selection decision, and commit the result.

Trainer review checklist

☐ Can the learner explain why the selected app model fits the scenario?

☐ Does the project run locally?

☐ Are configuration values externalized rather than hard-coded?

Day 02 & 03 | Building Code Apps with GitHub Copilot

Daily outcome: Build a modular application increment and use AI-assisted development responsibly with testing, review, diagnostics and documentation.

Learning objectives

- Build a modular application increment and use AI-assisted development responsibly with testing, review, diagnostics and documentation.
- Apply the day's concepts through three industry-aligned guided builds.
- Produce and review the Day 2 shipment as evidence of progress toward the capstone.

Instructor-led session plan | 10:00 AM–2:00 PM

Time	Block	Coverage / facilitation notes
10:00–10:20	Context & recap	Connect Day 2 to the running app-to-agent build. Review prior shipment and today's acceptance criteria.
10:20–11:05	Concept block 1	Reusable components, layered structure and separation of concerns; Power Fx and TypeScript boundaries for maintainable logic; GitHub Copilot for component generation, logic, documentation and tests.
11:05–11:15	Break	Short break and environment check.
11:15–12:15	Guided builds 1–2	Healthcare: generate and review a patient-intake component; Supply Chain: generate shipment-validation logic and unit tests.
12:15–1:05	Concept block 2	Safe AI-assisted development: explain, review, refactor and validate; Graceful failure, exception management and structured logging; Copilot-assisted debugging and failure-scenario testing.
1:05–1:45	Guided build 3 & integration	Banking: refactor and document a KYC module. Integrate the day's output into the running solution and test the target path.
1:45–2:00	Check & close	Run the knowledge check, review evidence, explain assignment and capture blockers.

Detailed topic coverage

- Reusable components, layered structure and separation of concerns
- Power Fx and TypeScript boundaries for maintainable logic
- GitHub Copilot for component generation, logic, documentation and tests
- Safe AI-assisted development: explain, review, refactor and validate
- Graceful failure, exception management and structured logging
- Copilot-assisted debugging and failure-scenario testing

Hands-on builds

- H1. Healthcare: generate and review a patient-intake component
- H2. Supply Chain: generate shipment-validation logic and unit tests
- H3. Banking: refactor and document a KYC module

Daily shipment and evidence

- Modular app increment
- Error handling and structured logging
- Unit tests
- Reviewed and committed AI-generated code

Post-lunch practice, Q&A and assignment

Add robust error handling and logging to a provided component, create at least two tests, and record what was changed after human review.

Trainer review checklist

☐ Is generated code reviewed rather than accepted blindly?

☐ Do tests cover normal and failure paths?

☐ Are components reusable and responsibilities separated?

Day 04 | Dataverse Integration & Enterprise Data

Daily outcome: Connect the app to governed enterprise data, implement relational CRUD, and apply performance and least-privilege patterns.

Learning objectives

- Connect the app to governed enterprise data, implement relational CRUD, and apply performance and least-privilege patterns.
- Apply the day's concepts through three industry-aligned guided builds.
- Produce and review the Day 3 shipment as evidence of progress toward the capstone.

Instructor-led session plan | 10:00 AM–2:00 PM

Time	Block	Coverage / facilitation notes
10:00–10:20	Context & recap	Connect Day 3 to the running app-to-agent build. Review prior shipment and today's acceptance criteria.
10:20–11:05	Concept block 1	Dataverse tables, columns, relationships and authentication; Create, read, update and delete across related entities; Dataverse business rules and client-side versus server-side validation.
11:05–11:15	Break	Short break and environment check.
11:15–12:15	Guided builds 1–2	Banking: model a customer-accounts schema; Insurance: implement policy and claims CRUD with relationships.
12:15–1:05	Concept block 2	Batching, query shaping, pagination and change tracking; Caching, minimized round-trips, concurrency and conflict handling; Row security, column security, teams and least-privilege access.
1:05–1:45	Guided build 3 & integration	Healthcare: enforce validation and row-level access. Integrate the day's output into the running solution and test the target path.
1:45–2:00	Check & close	Run the knowledge check, review evidence, explain assignment and capture blockers.

Detailed topic coverage

- Dataverse tables, columns, relationships and authentication
- Create, read, update and delete across related entities
- Dataverse business rules and client-side versus server-side validation
- Batching, query shaping, pagination and change tracking
- Caching, minimized round-trips, concurrency and conflict handling
- Row security, column security, teams and least-privilege access

Hands-on builds

- H1. Banking: model a customer-accounts schema

- H2. Insurance: implement policy and claims CRUD with relationships
- H3. Healthcare: enforce validation and row-level access

Daily shipment and evidence

- Dataverse-backed increment
- Validated CRUD across relationships
- Tuned queries and pagination
- Demonstrated access restriction

Post-lunch practice, Q&A and assignment

Add one validation rule and one row-level access restriction, then capture evidence that both work in the application.

Trainer review checklist

☐ Does the model represent relationships correctly?

☐ Are queries shaped to retrieve only needed data?

☐ Is security enforced in the data layer?

Day 5 & 6 | Business Logic, AI Builder & Intelligent Experiences

Daily outcome: Add an AI capability and a governed enterprise prompt while protecting users through confidence handling and human review.

Learning objectives

- Add an AI capability and a governed enterprise prompt while protecting users through confidence handling and human review.
- Apply the day's concepts through three industry-aligned guided builds.
- Produce and review the Day 4 shipment as evidence of progress toward the capstone.

Instructor-led session plan | 10:00 AM–2:00 PM

Time	Block	Coverage / facilitation notes
10:00–10:20	Context & recap	Connect Day 4 to the running app-to-agent build. Review prior shipment and today's acceptance criteria.
10:20–11:05	Concept block 1	AI Builder prebuilt and custom models for extraction, prediction and classification; Prompt Builder: structure, grounding, guardrails, testing and versioning; AI value patterns: extraction, summarization, suggestion and classification.
11:05–11:15	Break	Short break and environment check.
11:15–12:15	Guided builds 1–2	Insurance: extract structured claims-document data; Banking: build and test transaction-summary prompts.
12:15–1:05	Concept block 2	Calling AI Builder and prompts from application logic; Combining AI with Power Automate and business workflows; Responsible AI, low-confidence handling, human-in-the-loop, batching and cost control.
1:05–1:45	Guided build 3 & integration	Healthcare: implement a confidence-gated triage suggestion. Integrate the day's output into the running solution and test the target path.
1:45–2:00	Check & close	Run the knowledge check, review evidence, explain assignment and capture blockers.

Detailed topic coverage

- AI Builder prebuilt and custom models for extraction, prediction and classification
- Prompt Builder: structure, grounding, guardrails, testing and versioning
- AI value patterns: extraction, summarization, suggestion and classification
- Calling AI Builder and prompts from application logic
- Combining AI with Power Automate and business workflows
- Responsible AI, low-confidence handling, human-in-the-loop, batching and cost control

Hands-on builds

- H1. Insurance: extract structured claims-document data
- H2. Banking: build and test transaction-summary prompts
- H3. Healthcare: implement a confidence-gated triage suggestion

Daily shipment and evidence

- AI Builder-enabled increment
- Versioned enterprise prompt
- Five-input test record
- Fallback and human-review path

Post-lunch practice, Q&A and assignment

Test the enterprise prompt on five representative inputs, record quality observations, and demonstrate the low-confidence or failure path.

Trainer review checklist

☐ Is model output reviewed before irreversible action?

☐ Is the prompt versioned and evaluated?

☐ Does the application handle failure and low confidence?

Day 7 & 8 | Testing, ALM, Deployment & Capstone Framing

Daily outcome: Productionize the application, promote it through environments and define a measurable capstone challenge.

Learning objectives

- Productionize the application, promote it through environments and define a measurable capstone challenge.
- Apply the day's concepts through three industry-aligned guided builds.
- Produce and review the Day 5 shipment as evidence of progress toward the capstone.

Instructor-led session plan | 10:00 AM–2:00 PM

Time	Block	Coverage / facilitation notes
10:00–10:20	Context & recap	Connect Day 5 to the running app-to-agent build. Review prior shipment and today's acceptance criteria.
10:20–11:05	Concept block 1	Unit and integration testing, telemetry and cross-environment diagnostics; Authentication, least privilege, secrets and environment variables; Managed and unmanaged solutions, connection references and ALM.
11:05–11:15	Break	Short break and environment check.
11:15–12:15	Guided builds 1–2	Banking: test a payments module and add diagnostics; Finance: package a managed solution with environment variables.
12:15–1:05	Concept block 2	Packaging and dev-to-test-to-production promotion using pipelines; CI/CD and production-readiness across security, performance, governance and observability; Capstone problem selection, success metrics and evaluation planning.
1:05–1:45	Guided build 3 & integration	Supply Chain: configure connection references and deploy to test. Integrate the day's output into the running solution and test the target path.
1:45–2:00	Check & close	Run the knowledge check, review evidence, explain assignment and capture blockers.

Detailed topic coverage

- Unit and integration testing, telemetry and cross-environment diagnostics
- Authentication, least privilege, secrets and environment variables
- Managed and unmanaged solutions, connection references and ALM
- Packaging and dev-to-test-to-production promotion using pipelines
- CI/CD and production-readiness across security, performance, governance and observability
- Capstone problem selection, success metrics and evaluation planning

Hands-on builds

- H1. Banking: test a payments module and add diagnostics
- H2. Finance: package a managed solution with environment variables
- H3. Supply Chain: configure connection references and deploy to test

Daily shipment and evidence

- Packaged solution
- Deployment to test environment
- Production-readiness checklist
- One-page capstone brief

Post-lunch practice, Q&A and assignment

Complete the production-readiness checklist and capstone brief, including problem, users, baseline, success metrics, governance risks and evaluation plan.

Trainer review checklist

☐ Can the solution be promoted without hard-coded settings?

☐ Are tests and diagnostics available?

☐ Is the capstone narrow, measurable and feasible?

Day 9 & 10 | Copilot Studio: Enterprise Agent Design

Daily outcome: Design the agent half of the solution and connect conversational experiences to governed application data.

Learning objectives

- Design the agent half of the solution and connect conversational experiences to governed application data.
- Apply the day's concepts through three industry-aligned guided builds.
- Produce and review the Day 6 shipment as evidence of progress toward the capstone.

Instructor-led session plan | 10:00 AM–2:00 PM

Time	Block	Coverage / facilitation notes
10:00–10:20	Context & recap	Connect Day 6 to the running app-to-agent build. Review prior shipment and today's acceptance criteria.
10:20–11:05	Concept block 1	Copilot Studio architecture, runtime, channels and lifecycle; Agent scope, persona, intent and business boundaries; Topics, trigger phrases, entities, variables and slot validation.
11:05–11:15	Break	Short break and environment check.
11:15–12:15	Guided builds 1–2	Banking: build a multi-topic servicing agent; Insurance: design triggers and entities for claims queries.
12:15–1:05	Concept block 2	Conversation flow, branching, disambiguation, fallback and Adaptive Cards; Short- and long-term context and memory considerations; Dataverse connection and multi-topic orchestration.
1:05–1:45	Guided build 3 & integration	Supply Chain: add Adaptive Cards and connect to Dataverse. Integrate the day's output into the running solution and test the target path.
1:45–2:00	Check & close	Run the knowledge check, review evidence, explain assignment and capture blockers.

Detailed topic coverage

- Copilot Studio architecture, runtime, channels and lifecycle
- Agent scope, persona, intent and business boundaries
- Topics, trigger phrases, entities, variables and slot validation
- Conversation flow, branching, disambiguation, fallback and Adaptive Cards
- Short- and long-term context and memory considerations
- Dataverse connection and multi-topic orchestration
- Streamlined UI
- Reusable Skills & Markdown
- Workflows
- Real-time agent

Hands-on builds

- H1. Banking: build a multi-topic servicing agent
- H2. Insurance: design triggers and entities for claims queries
- H3. Supply Chain: add Adaptive Cards and connect to Dataverse

Daily shipment and evidence

- Multi-topic enterprise agent
- Adaptive Card interaction
- Connection to app data
- Locked hackathon problem and success metrics

Post-lunch practice, Q&A and assignment

Use the provided hackathon template to finalize the problem statement, intended users, expected outcome, non-goals and success metrics.

Trainer review checklist

☐ Are topics tightly scoped and testable?

☐ Are fallback and disambiguation included?

☐ Does the agent use governed rather than ad-hoc data?

Embedded programme event: Hackathon kick-off: finalize the problem and success metrics using the programme template.

Day 11 | Generative AI, Knowledge & RAG

Daily outcome: Ground the agent in enterprise knowledge, show citations, respect permissions and measure answer faithfulness.

Learning objectives

- Ground the agent in enterprise knowledge, show citations, respect permissions and measure answer faithfulness.
- Apply the day's concepts through three industry-aligned guided builds.
- Produce and review the Day 7 shipment as evidence of progress toward the capstone.

Instructor-led session plan | 10:00 AM–2:00 PM

Time	Block	Coverage / facilitation notes
10:00–10:20	Context & recap	Connect Day 7 to the running app-to-agent build. Review prior shipment and today's acceptance criteria.
10:20–11:05	Concept block 1	Generative answers versus authored topics and prompt patterns; Grounding, source boosting and filtering; Knowledge sources: Dataverse, SharePoint, Fabric, Azure AI Search, websites and documents.
11:05–11:15	Break	Short break and environment check.
11:15–12:15	Guided builds 1–2	Banking: configure generative answers for policy FAQs; Finance: ground an expense agent on policy documents.
12:15–1:05	Concept block 2	RAG concepts: retrieval, chunking, indexing, freshness and citations; Responsible AI, moderation, permission-aware retrieval and audit trails; Testing with session, resolution, escalation, faithfulness and safety measures.
1:05–1:45	Guided build 3 & integration	Supply Chain: configure RAG over SharePoint logistics SOPs. Integrate the day's output into the running solution and test the target path.
1:45–2:00	Check & close	Run the knowledge check, review evidence, explain assignment and capture blockers.

Detailed topic coverage

- Generative answers versus authored topics and prompt patterns
- Grounding, source boosting and filtering
- Knowledge sources: Dataverse, SharePoint, Fabric, Azure AI Search, websites and documents
- RAG concepts: retrieval, chunking, indexing, freshness and citations
- Responsible AI, moderation, permission-aware retrieval and audit trails
- Testing with session, resolution, escalation, faithfulness and safety measures

Hands-on builds

- H1. Banking: configure generative answers for policy FAQs
- H2. Finance: ground an expense agent on policy documents

- H3. Supply Chain: configure RAG over SharePoint logistics SOPs

Daily shipment and evidence

- Grounded agent
- Visible citations
- Permission-aware retrieval design
- Five-question faithfulness record

Post-lunch practice, Q&A and assignment

Configure one approved knowledge source, test five business questions, verify citations and record accurate, incomplete and unsupported responses.

Trainer review checklist

☐ Are answers grounded and cited?

☐ Are user permissions respected?

☐ Has faithfulness been tested against real questions?

Day 12 | Agent Actions, Computer Use & Automation

Daily outcome: Enable governed actions across APIs and API-less systems while maintaining confirmation, audit and human oversight.

Learning objectives

- Enable governed actions across APIs and API-less systems while maintaining confirmation, audit and human oversight.
- Apply the day's concepts through three industry-aligned guided builds.
- Produce and review the Day 8 shipment as evidence of progress toward the capstone.

Instructor-led session plan | 10:00 AM–2:00 PM

Time	Block	Coverage / facilitation notes
10:00–10:20	Context & recap	Connect Day 8 to the running app-to-agent build. Review prior shipment and today's acceptance criteria.
10:20–11:05	Concept block 1	Power Automate, REST actions and safe action design; Custom connectors, Microsoft Graph, Dataverse actions and Azure Functions; Computer Use architecture and appropriate use cases.
11:05–11:15	Break	Short break and environment check.
11:15–12:15	Guided builds 1–2	Banking: call a core-banking API through a custom connector; Supply Chain: automate a restricted logistics portal task.
12:15–1:05	Concept block 2	Instructions, dynamic inputs and credential management; Allow-lists, human-in-the-loop, session replay and Purview audit; DLP, safe autonomy and preference for APIs when available.
1:05–1:45	Guided build 3 & integration	Finance: design audited posting into an API-less accounting system. Integrate the day's output into the running solution and test the target path.
1:45–2:00	Check & close	Run the knowledge check, review evidence, explain assignment and capture blockers.

Detailed topic coverage

- Power Automate, REST actions and safe action design
- Custom connectors, Microsoft Graph, Dataverse actions and Azure Functions
- Computer Use architecture and appropriate use cases
- Instructions, dynamic inputs and credential management
- Allow-lists, human-in-the-loop, session replay and Purview audit
- DLP, safe autonomy and preference for APIs when available

Hands-on builds

- H1. Banking: call a core-banking API through a custom connector

- H2. Supply Chain: automate a restricted logistics portal task
- H3. Finance: design audited posting into an API-less accounting system

Daily shipment and evidence

- Action-enabled agent
- Governed connector or flow
- Restricted Computer Use proof of concept or design
- Oversight and audit plan

Post-lunch practice, Q&A and assignment

Document an API-less automation, including allowed applications, credential approach, confirmation points, exception handling, session evidence and owner.

Trainer review checklist

☐ Is there confirmation for consequential actions?

☐ Are credentials and target sites restricted?

☐ Is the action idempotent or protected from duplicate execution?

Embedded programme event: EXL SME session: reserve 30–40 minutes to connect the build to delivery realities and client expectations.

Day 13 | Multi-Agent Orchestration, MCP & Governance

Daily outcome: Scale the solution through connected agents and governed tools, with clear context boundaries, DLP and monitoring.

Learning objectives

- Scale the solution through connected agents and governed tools, with clear context boundaries, DLP and monitoring.
- Apply the day's concepts through three industry-aligned guided builds.
- Produce and review the Day 9 shipment as evidence of progress toward the capstone.

Instructor-led session plan | 10:00 AM–2:00 PM

Time	Block	Coverage / facilitation notes
10:00–10:20	Context & recap	Connect Day 9 to the running app-to-agent build. Review prior shipment and today's acceptance criteria.
10:20–11:05	Concept block 1	Parent-child and connected-agent patterns; Delegation, orchestration and decomposition decisions; Shared versus per-agent context and long-running interactions.
11:05–11:15	Break	Short break and environment check.
11:15–12:15	Guided builds 1–2	Banking: connected servicing agents with delegation; Finance: connect an enterprise system via MCP.
12:15–1:05	Concept block 2	Agent2Agent and Model Context Protocol integration concepts; Authentication, authorization, least privilege, connectors and DLP; Dev, test and production environments, monitoring and incident response.
1:05–1:45	Guided build 3 & integration	Healthcare: configure DLP, authentication and monitoring. Integrate the day's output into the running solution and test the target path.
1:45–2:00	Check & close	Run the knowledge check, review evidence, explain assignment and capture blockers.

Detailed topic coverage

- Parent-child and connected-agent patterns
- Delegation, orchestration and decomposition decisions
- Shared versus per-agent context and long-running interactions
- Agent2Agent and Model Context Protocol integration concepts
- Authentication, authorization, least privilege, connectors and DLP
- Dev, test and production environments, monitoring and incident response

Hands-on builds

- H1. Banking: connected servicing agents with delegation
- H2. Finance: connect an enterprise system via MCP

- H3. Healthcare: configure DLP, authentication and monitoring

Daily shipment and evidence

- Connected-agent solution
- Governed MCP integration design
- DLP policy
- Environment and monitoring strategy

Post-lunch practice, Q&A and assignment

Define the capstone DLP policy, connector inventory, environment path, telemetry, alert owner and incident-response route.

Trainer review checklist

☐ Does multi-agent decomposition add clear value?

☐ Is shared context deliberate and minimal?

☐ Are MCP tools authenticated, authorized and auditable?

Day 14 & 15 | Capstone Build & Shark Tank Finale

Daily outcome: Integrate, validate and present the complete solution with a reliable demo, outcome evidence, ROI and governance narrative.

Learning objectives

- Integrate, validate and present the complete solution with a reliable demo, outcome evidence, ROI and governance narrative.
- Apply the day's concepts through three industry-aligned guided builds.
- Produce and review the Day 10 shipment as evidence of progress toward the capstone.

Instructor-led session plan | 10:00 AM–2:00 PM

Time	Block	Coverage / facilitation notes
10:00–10:20	Context & recap	Connect Day 10 to the running app-to-agent build. Review prior shipment and today's acceptance criteria.
10:20–11:05	Concept block 1	Integration of Code App, Dataverse, AI features, agent and actions; Outcome measures: task success, quality, cost and cycle time; Demo engineering, repeatable path and recorded fallback.
11:05–11:15	Break	Short break and environment check.
11:15–12:15	Guided builds 1–2	Team build: integrate app and agent; Team evidence: capture evaluation and cost/ROI view.
12:15–1:05	Concept block 2	ROI narrative, risk controls, security, DLP and audit story; Pitch structure and rubric: problem, solution, execution, proof, ROI, responsible AI and storytelling; Post-program next steps and handover artefacts.
1:05–1:45	Guided build 3 & integration	Team rehearsal: pitch, demo and judge Q&A. Integrate the day's output into the running solution and test the target path.
1:45–2:00	Check & close	Run the knowledge check, review evidence, explain assignment and capture blockers.

Detailed topic coverage

- Integration of Code App, Dataverse, AI features, agent and actions
- Outcome measures: task success, quality, cost and cycle time
- Demo engineering, repeatable path and recorded fallback
- ROI narrative, risk controls, security, DLP and audit story
- Pitch structure and rubric: problem, solution, execution, proof, ROI, responsible AI and storytelling
- Post-program next steps and handover artefacts

Hands-on builds

- H1. Team build: integrate app and agent

- H2. Team evidence: capture evaluation and cost/ROI view
- H3. Team rehearsal: pitch, demo and judge Q&A

Daily shipment and evidence

- Working app-plus-agent solution
- Proof-of-outcomes pack
- Architecture and governance summary
- Shark Tank pitch and demo

Post-lunch practice, Q&A and assignment

Submit the final solution evidence pack and project record, including repository, deployment notes, test evidence, evaluation results, demo fallback and ownership plan.

Trainer review checklist

☐ Does the live demo prove the claimed capability?

☐ Are outcome and ROI claims supported by evidence?

☐ Can the team explain limitations, controls and next steps?

Embedded programme event: Shark Tank finale: teams present the working solution and defend outcomes, ROI, governance and responsible AI.

3. Capstone Framework

Teams should select one focused enterprise problem and retain the same build thread across both weeks. The capstone must demonstrate an application, governed data, an agent experience, at least one intelligent capability, an action or automation, and measurable evidence.

Required solution components

- Enterprise Code App
- Dataverse data model and access controls
- AI Builder or Prompt Builder capability
- Copilot Studio agent with conversation design
- Grounded knowledge with citations
- Governed action, connector or automation
- ALM, environment configuration and deployment evidence
- Testing, monitoring, DLP and audit approach

Evidence pack

- Problem statement, users, baseline and non-goals
- Architecture and data-flow diagram
- Repository and deployment notes
- Test results and prompt/agent evaluation record
- Security, permission, DLP and responsible-AI controls
- Outcome measures and cost/ROI assumptions
- Reliable demo script with recorded fallback
- Ownership, limitations and next-step plan

Suggested Shark Tank scoring rubric

Criterion	Points	What judges should look for
Problem and user value	15	Clear need, defined users and narrow scope
Solution design	15	Coherent app, data and agent architecture
Execution and reliability	20	Working build, tests, deployment and dependable demo
Evidence and outcomes	15	Measured task success, quality or cycle-time improvement
ROI and scalability	10	Transparent assumptions and realistic adoption path
Governance and responsible AI	15	Security, permissions, DLP, audit, fallbacks and human oversight
Pitch and Q&A	10	Crisp story, role clarity and defensible answers

Recommended trainer preparation

- Validate environment access, licenses, sandboxes, repositories and sample data before Day 1.
- Provide one starter scenario per industry lane and a common capstone template.
- Prepare known-good samples for each day's shipment and failure-path demonstrations.
- Define the submission location, naming convention and evidence checklist.
- Arrange the Day 8 SME and Day 10 judging panel, rubric and presentation order.

- Retain a fallback demo recording and offline screenshots for platform-dependency risks.

Source note

Prepared from “Enterprise Apps & Agents — Power Platform Specialisation” (13-page programme document provided in the active browser tab). The four-hour daily timing, themes, tools, hands-on builds, programme events and daily shipments reflect the source. Detailed facilitation timings, assessment weights, achievement descriptors and judge scoring are clearly presented as recommended delivery design.
